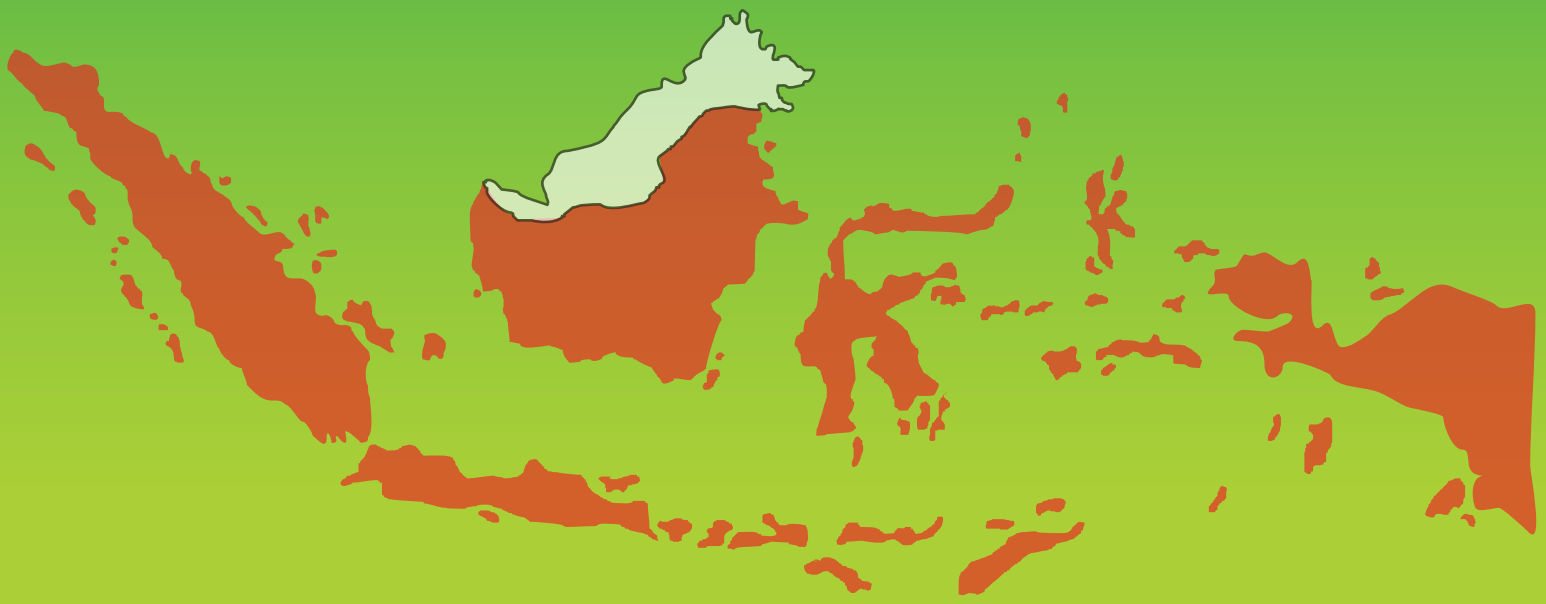
PT. PRONDT INDO UTAMA

NDT TECHNICAL SERVICE, HYDROTEST AND CERTIFICATION

Company Profile

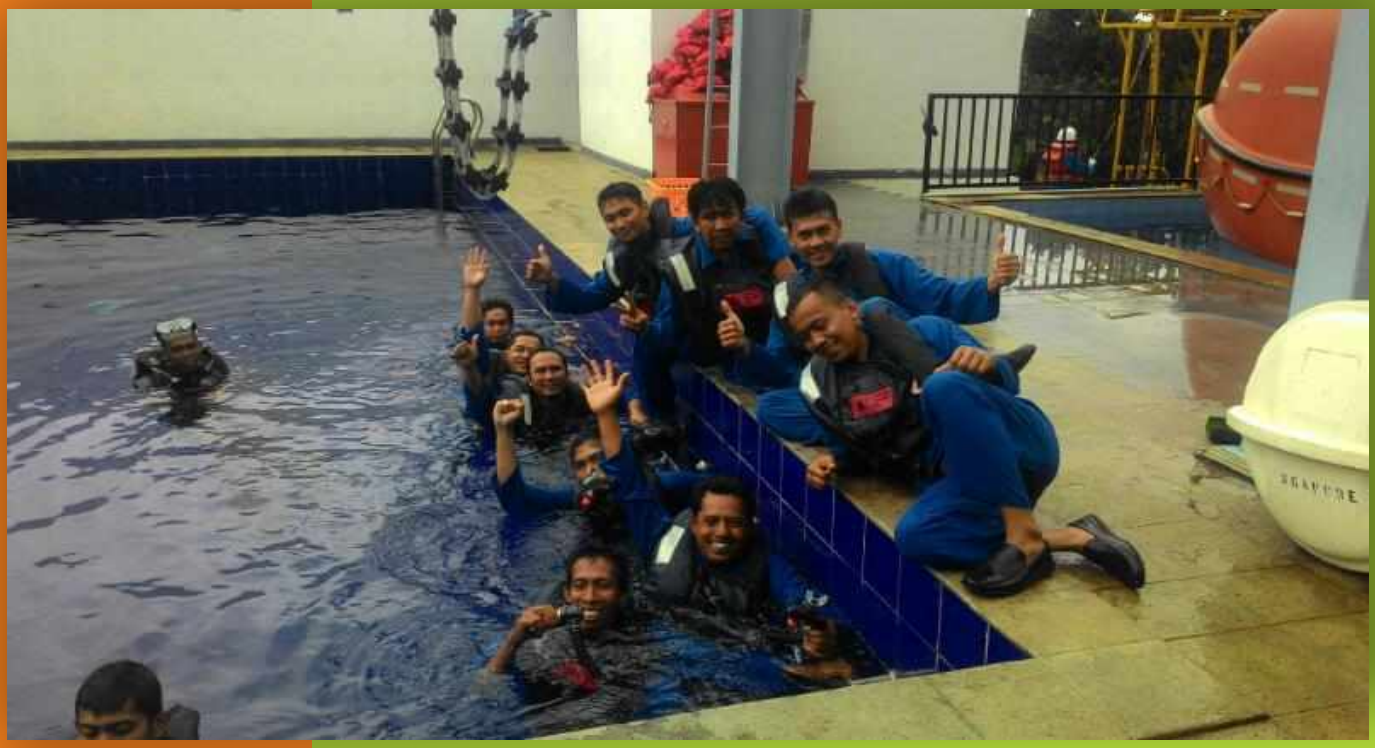
PROVISION FOR NON DESTRUCTIVE TESTING (NDT) SERVICES, INSPECTION SERVICES AND HYDRO TEST FOR OIL & GAS, GEOTHERMAL, MINING AND INDUSTRIAL FACILITY



Member Of APITINDO Membership Number 401/2020

TRAINING AND METTING

PT. PRONDT INDO UTAMA NDT TECHNICAL SERVICE, HYDROTEST AND CERTIFICATION

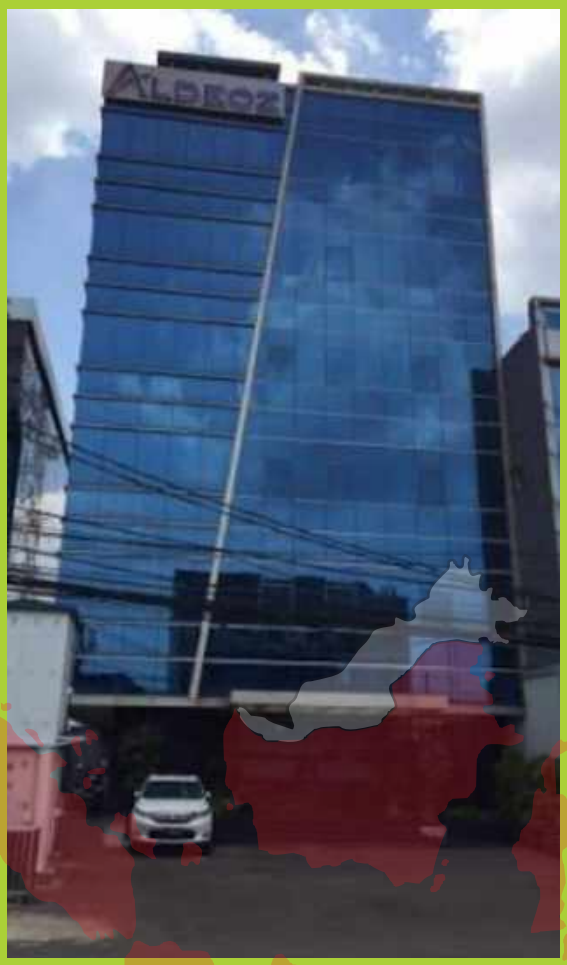


about us profile

PT. PRONDT INDO UTAMA

NDT TECHNICAL SERVICE, HYDROTEST AND CERTIFICATION

about us profile



Established in 2019, PT Prondt Indo Utama (PIU)is a company which core business is in Inspection and Technical Services of Oil & GAS processing, refining, petrochemical plant & equipment, and geothermal which conform to the Customer's contract requirements and International Codes of Practice.

PT Prondt Indo Utama is fully staffed, equipped, and authorized, with complete licences that are approved by MIGAS and the Safety Board of Development of Man Power is a Third Party Inspection Company. A few years ago, We are registered in the Directorate General Oil and Gas (MIGAS). We are consist of professional expertise of International Standards to the Oil and Gas industries in performing its inspection and technical services. PT Prondt Indo Utama is headed by a professional and expert in this business.

We also realize that safety precaution is a major aspect of industrialization that the Indonesian Government is well aware of since it is proofed by various regulations that have been issued. In this high risk, high-technology business, a mistake can cost you human lives, time, money, and lost of production.

VISION AND MISSION

PT. PRONDT INDO UTAMA NDT TECHNICAL SERVICE, HYDROTEST AND CERTIFICATION

VISION & MISSION

vision & mission

Vision

Become a professional leader on NDT and Certification Company and reliable to our customer.

Mission

Provision NDT inspection which conform International code and practice.
Supply Qualified Inspector for Oil & Gas and Geothermal Industry.
Highly trained human resources it achieve customer's satisfaction.
Develop and maintain program on Health Safety Environment.

Values

Customer first
Team work
Communication

Non Destructive Test / NDT Inspection Method

- Radiography Test, X-ray Machine, Gamma Ray IR-192, Computerized Radiography
- Magnetic Particle Test
- Dye or liquid Penetrrant Test
- Ultrasonic Test
- Long Range Ultrasonic Testing of Piping and Pipelines
- Ultrasonic C-Scan remotely operated crawler
- Borroscope/Video Scope Inspection
- Wire Rope Test & Load Cell
- Hydrostatic Testing
- PMI Testing
- Holiday Detector
- Intelligent Pigging Services
- Post Weld Heat Treatment

Other Supply on Oil & Gas and Geothermal

- Piping Inspector / API 570
- Storage tank Inspector / API 653
- Radiographer ASNT Level 2
- Radiation Protection Officer
- OR/Operator Radiography ASNT Level 1
- UT Technician ASNT Level 2
- MT - PT Technician ASNT Level 2

services

Radiography Test

Radiographic Testing (RT) uses ionizing electromagnetic radiation to view objects in away that can't be seen otherwise. It is not to be confused with the use of ionizing radiation to change or modify objects; radiography's purpose is strictly for viewing. It is a method of inspecting materials for hidden flaws by using the capability of short wavelength electromagnetic radiation, gamma radiation, to penetrate various materials.

Gamma radiation sources, commonly Iridium-192 (Ir 192) and Cobalt 60 (Co 60), are used to inspect a variety of materials. Radiography concerns the testing materials include concrete)locating rebar or conduit), welder's test coupons, machined parts, plate metal, or pipe wall (locating anomalies due to corrosion or mechanical damage). Theoretically, industrial radiographers could radiograph any solid, flat material (walls, ceilings, floors, square or rectangular containers) or any hollow cylindrical or spherical object.

Radiography Using Gamma Camera on Welds

Radiography is one of the useful of the non-destructive tests which can be applied for assessing the quality of the welded joints on pressured piping, pressure vessel, high capacity storage tank, pipelines, and some structural welds.

Radiography can detect flaws or discontinuities in welds such as:

- Crack
- Porosity and blow holes
- Slag, flux oxide inclusions
- Lack of fusion
- Incomplete penetration
- Root fusion
- Incomplete penetration
- Root fusion
- Clustered porosity
- External & internal undercut, etc.

Magnetic Particle Test

Magnetic Particle Inspection

Magnetic Particle Inspection is a non-destructive testing method used for detecting surface and near surface flaws and defects. MPI is fast and relatively easy to apply, and surface preparation is not as critical as it is for other NDT methods. These characteristics make MPI one of the most widely utilized non-destructive testing methods. MPI uses magnetic fields and small magnetic particles similar to iron filings to detect flaws in components. The only real limitation is that the component being inspected must be made of a ferromagnetic material such as iron, nickel, cobalt, or one of heir alloys. The method is used to inspect a variety of product forms including castings, forgings, and welds. The structural steel, automotive, petrochemical, power generation, and aerospace industries are a few examples that utilize magnetic particle inspection.

This method of non-destructive testing tends to supplement rather than displace radiography. For example, radiography ordinarily cannot detects small cracks, especially when they are too small to be seen with human eye.

This method of inspection is used on magnetic ferrous weldments for detecting invisible surface of slightly subsurface defects*. Deeper subsurface defects are not satisfactorily detected because the influence of the distorted line of magnetic flux (owing to a discontinuity) on the magnetic particle spread over the job surface becomes weaker with the distance, so that sensitivity falls away rapidly with the depth.

The defects commonly revealed by magnetic particle inspection are quenching cracks, thermal cracks, seams. lap, grinding cracks, overlaps, non-metallic inclusions, fatigue cracks, hot tears, etc.

magnetic particle inspection is a relatively simple and easy technique. It is almost free from any restriction as to size, shape, composition and heat-treatment of a ferromagnetic specimen.

Dye or Liquid Penetrant Test

Liquid Dye Penetrant Test

A liquid penetrant test is non-destructive type. It detect flaws that are open to the surface e.g., cracks, seams, laps, lack of bond, porosity, cold shuts, etc. It can be effectively used not only in the inspection of ferrous metals but is especially useful for non-ferrous metal products and on non-porous, non-metallic materials such as ceramics, plastics and glass.

They are also influenced by factors such as the condition of the surface of material and the interior of the discontinuity. For the liquid to penetrate effectively, the surface of the material must be thoroughly cleaned of all foreign matter that would obstruct the entrance of the liquid into the defect.

After cleaning, the liquid penetrant is applied evenly over the surface and allowed to remain long enough to permit penetration onto possible discontinuities. The liquid is then completely from the surface of the component and either a wet or a dry developer is applied. The liquid that has penetrated the defects will then bleed out onto the surface, and the developer will help delineate them.

This will show the location and general nature and magnitude of any defect present. To hasten this action, the part may be struck sharply to produce vibrations to force the liquid out of the defect. The oil-whiting test is one of the older and cruder penetrant test used for the detection of cracks too small to be noticed in a visual inspection. In this method, the piece is covered with penetrating oil, such as kerosene, than rubbed dry and coated with dry whiting.

in a short time the oil that has seeped into any cracks will be partially absorbed by the whiting, producing plainly visible discolored streaks delineating the cracks.

the Dye Penetrant Test (DPT) based on liquid penetrant is a sensitive extremely versalite and a very reliable method of test. It is quite inexpensive, does not require any special apparatus and is quite simple on application. Only a moderate skill is required. In this test, the strongly coloured red penetrant fluid (or dye) has a property of seeping into surface flaws when applied on a impervious surface.

The steps involved in dye penetrant test are :

1. Clean the surface of the component free of dust and drt with a piece of cloth.
2. Brush the surface of the component to remove scale, rust, paint, etc, by a soft wire brush.
3. Spray the cleaner to remove oil, grease, etc.
4. Apply the dye penetrant (by spraying) adequately to cover the area to be tested. Allow 3 to 5 minutes or more for dye to penetrate onto the cracks.
5. Wipe off the excess penetrant on the surface with a rag.
6. Again spray the surface with the cleaner to remove the remnants of the red dye.
7. The developer evenly on the surface to give a thin even layer. This layer absorbs the penetrant from the cracks and red spots or lines appear on the surface to give a visible indication of the flaws.
8. The crack if any will be indicated with the red dye absorbed by the white absorbent.

Ultrasonic Test

Ultrasonic Test

Ultrasonic Testing (UT) uses high frequency sound energy to conduct examinations and make measurements. Ultrasonic inspection can be used for flaw detection/ evaluation, dimensional measurements, material characterization, and much more. Although there are a number of technologies employing ultrasound, the simplest explanation of what happens in this method is that sound energy is introduced via a transducer and propagates through the materials in the form of waves.

When there is a discontinuity (such as a crack) in the wave path, part or the energy will be reflected back from the flaw surface. The reflected wave signal is transformed into and electrical signal by the transducer and is displayed or recorded in a variety of ways.

Both surface and subsurface defects can be detected making ultrasonic a volumetric testing method. Application vary in complexly from very small, hand-held manual units to very large, sophisticated automated system. This method is used to inspect a variety of product from including castings, forgings, and weldments. The structural steel, automotive, petrochemical, power generation, and aerospace industries are a few examples that utilize inspection.

PT. PRONDT INDO UTAMA NDT TECHNICAL SERVICE, HYDROTEST AND CERTIFICATION

HYDRO TEST

Hydrostatic Test is a way to test the strength and leaks in pressure vessels - such as boilers, heat exchangers, reactors, piping or tanks using liquid fluid media (usually air). The way to carry out a hydrostatic test is to put water into a pressure vessel or pipe at a certain pressure. Then, the pressurized condition is held for a certain period of time in accordance with the reference standard used. If no holes are found and the air pressure inside is constant, it can be concluded that the pressure vessel or piping tested has passed the test. The hydrostatic test is carried out at a pressure higher than the design pressure. For example, according to ASME B31.1, the hydrostatic test pressure of a piping system should not be less than 1.5 times the design pressure, but should not exceed the maximum allowable pressure test limit.And this test is carried out for a minimum of 10 minutes at the test hydrostatic pressure.

Wire Rope Test & Load Cell

Wire Rope Test & Load Cell

Wire rope or cable is made by weaving many individual wires together to produce a product that is both strong and flexible. Wire rope is used in many safety critical applications in addition to chair lift and gondola systems. Some of these applications include hoisting systems, such as cranes and winches; guy wires used in tall antennas and towers; and mooring lines of oil drilling platforms at sea. A cable failure in one of these applications could have very serious consequences.

All wire rope eventually wears out making periodic inspections necessary throughout the service life of the rope. Wire rope is prone to damage and wear due to abrasion, fatigue, corrosion, and improper handling. NDT personnel look for localized flaws or loss of metallic cross-sectional area using a variety of inspection methods. The least sophisticated method is visual inspection. Inspector simply look for broken strands, wear and corrosion on the surface of the cable. However, for a more thorough evaluation, a number of instruments have been developed that allow inspectors to assess the internal areas of the cable.

One of the more widely used of these instruments uses magnetism to inspect the rope. The inspection instrument is placed around the wire rope and moved along the rope or the rope is pulled through the instrument.

Strong permanent magnets or electromagnets are used to create a strong magnetic field within the rope. The rope is said to be magnetically saturated because it is caring all the magnet flux that it possibly can. In areas where the rope is damaged, it can not support as much of the magnet flux and some of it "leaks" out of the rope. Sensors in the inspection head detect the magnetic flux leakage caused by the internal or external defects in the rope. Defects as small as 0.05 % of the rope's cross-sectional area can often be detected.

Computer Radiography

For every application the right filters and measuring tools

Automatic Wall Thickness Measuring

With use of the optionally available wall thickness measuring tools, the definition of remaining wall thickness becomes quite simple.
The measuring tool takes into account whether manual calibration data is input or whether exposure parameters have been recorded, as required by the technique of radiographic projection.

Histogram Equalization

Equalization of the grey values in the histogram enables the simultaneous optical evaluation of different density materials.

High contrast filter

The filter allows to optimize the contrast ratio of the image. The original data always remains unchanged.

Cast - Inspection

For casting inspection specific filters are required to distinguish precisely the outer edged of the object.
Measurements can be performed as well as displayin the image in virtual 3-D.
Customer-designed measurement tools can be development on request.

Positive Material Identification (PMI)

What Is PMI? How to Do It? An Introduction to Positive Material Identification Analysis

PMI (Positive Material Identification) testing is the analysis of materials to determine the chemical composition of a metal or alloy at particular (usually multiple) steps of alloy manufacturing or in-process alloy installation. Knowing the exact composition and grade of an alloy enables suppliers, plant workers, and other responsible parties in the chain of custody of components to match alloy specifications that are chosen for their specific properties such as heat resistance, corrosion resistance, durability, etc. Having the right alloy in the right place is essential in places like petroleum refineries and chemical plants, because the right alloy with the right properties is often all that stands between a safe, efficient operation and lost time and revenue.

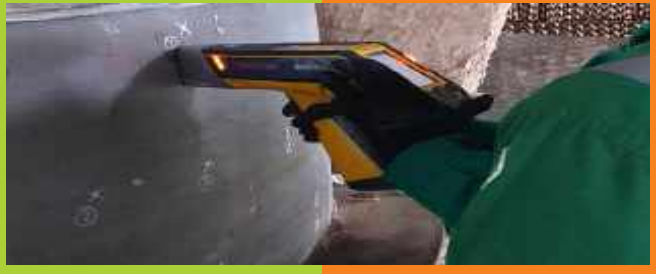
Stainless steel grades differ by chemical composition. The key differences between the various grades are mainly the amount of Fe (iron), Cr (chromium), Ni (nickel), Mo (molybdenum), and Cu (copper). Some grades are very different from each other and have different properties; for example, 400 series stainless steels are magnetic while 300 series stainless steels are not. Other grades are more similar with very similar properties, and it is much harder to tell the difference between them without the aid of technology. For example, 304SS has 18-20% Cr and 8-10.5% Ni, whereas 316SS has 16-18% Cr and 10-14% Ni. Although these alloys are very close in composition, they respond differently to corrosive chemicals and higher temperatures making it necessary to be certain you are using the correct alloy for the job intended.

PMI at Every Step: Frosm the Warehouse to In-Process

Because a materials mix-up can happen at any stage of the process from the alloy fabricator to installation of a part at the refinery, each petroleum refinery, chemical plant, petrochemical plant etc. should develop a material verification program to minimize this risk. It is important to check every alloy and component multiple times during every stage; this is known as a 100% PMI protocol. The material verification program/PMI process should begin at the incoming materials warehouse, where product may be tested via a PMI spot check method as part of the receiving process. As well as PMI testing, a material verification program should provide complete and accurate documentation indicating which materials have been tested and what the results were.

Calibration Checks and Process Control for Alloy XRF

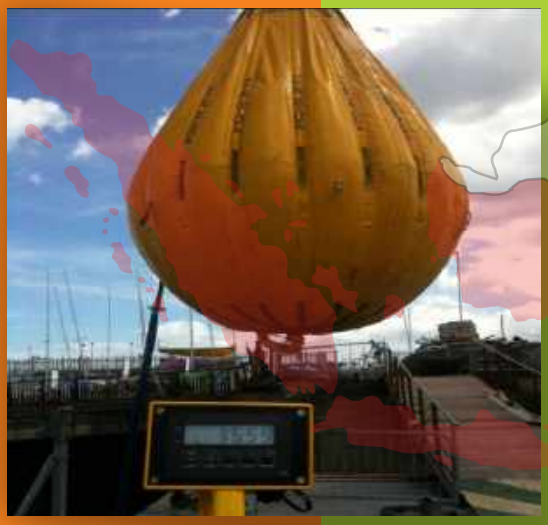
If you work in an alloy testing lab where alloy grade verification is your job, you probably use some form of XRF alloy tester or analyser for PMI. These instruments come in bench-top and handheld form, and while many of them can be operated by a novice user, it takes an expert to assure that data is being reported properly, that instruments are well-maintained, calibrated, and tested, and that any drift in results in monitored and controlled for. This is especially true for large bench-top instruments.



LOAD TEST

What is Load testing?

Load testing is a kind of performance Testing which determines a system's performance under real-life load conditions. This testing helps determine how the application behaves when multiple users access it simultaneously



This testing usually identifies :

- The Maximum Operating capacity of an application
- Determine whether the current infrastructure is sufficient to run the application
- Sustainability of application with respect to peak user load
- Number of concurrent users that an application can support, and scalability to allow more users to access it.

Why Load Testing?

- Load testing gives confidence in the system & its reliability and performance.
- Load Testing helps identify the bottlenecks in the system under heavy user stress scenarios before the happen in a production environment.
- Load Testing gives excellent protection against poor performance and accommodates complementary strategies for performance management and monitoring of a production environment.

Vacuum Box Testing

The vacuum box test is a non-destructive examination used to detect weld seam leaks. A vacuum box and compressor create a high or low pressure vacuum while a detergent solution is applied to the test area. The detergent bubbles, revealing leaks within the pressure range created. This test method is suitable for leak detection on pipes, containers and sheet metal structures.

The purpose of the vacuum box technique of bubble leak testing is to detect leaks in a pressure boundary that cannot be directly pressurized. of the boundary, causing bubbles to form as leak gas flowsthrough the solution. Inspection capabilities with Vacuum box tests

HARDNESS TEST

Hardness testing is a non-destructive test method that involves applying a constant load via a rounded or pointed object, under controlled conditions, to create an indentation in a metal surface. This is then measured to determine the hardness of the material.

Process	Shore A	Shore D	Ball Hardness	Rockwell Hardness
Standards	ISO 868 DIN 53 505	ISO 868 DIN 53 505	ISO 2039-1 DIN 53 456	ISO 2039-2
Indenter	Truncated cone 1,25 Ø 35° 0,79 Ø	Cone 1,25 Ø 30° r = 0,1	Ball 5 mm Ø Minor load Test load	Ball Skale M: 6,35 mm Skale R: 12,7 mm Measures only permanent deformation, as measurement is done after removal of load
Test load	9,81 N	49,05 N	Steps for test load 49, 132, 358, 661 N depending on hardness	Skale M: 980 N Skale R: 588 N
Holding time	15 s	15 s	30 s	15 s
Uses	Soft elastomers, very soft thermoplastics	Hard elastomer, soft thermoplastics	Thermoplastics	Thermoplastics

Email	:	-
Nama KBLI	:	Perdagangan Besar Mesin, Peralatan Dan Perlengkapan Lainnya, Aktivitas Konsultasi Manajemen Lainnya, Aktivitas Penyewaan Dan Sewa Guna Usaha Tanpa Hak Opsi Mesin, Peralatan Dan Barang Berwujud Lainnya Ytdl
Kode KBLI	:	46599, 70209, 77309
Jenis API	:	Angka Pengenal Importir Umum (API - U)
Status Penanaman Modal	:	PMDN

NIB merupakan identitas Pelaku Usaha dalam rangka pelaksanaan kegiatan berusaha dan berlaku selama menjalankan kegiatan usaha sesuai ketentuan peraturan perundang-undangan.

NIB adalah bukti Pendaftaran Penanaman Modal/Berusaha yang sekaligus merupakan pengesahan Tanda Daftar Perusahaan , Angka Pengenal Importir dan hak akses kepabeanan.

OSS berwenang untuk melakukan evaluasi dan/atau perubahan atas izin usaha (izin komersial/operasional) sesuai ketentuan perundang-undangan.

OSS berwenang memperbaiki status atas API-U atau API-P sesuai karakteristik pelaku usaha (perseorangan atau non-perseorangan). Ke-efektifan API sesuai dengan standar yang ditetapkan Kementerian Perdagangan.

NIB atas Perseroan Terbatas dibekukan apabila dalam kurun waktu paling lama 1 (satu) tahun tidak menyesuaikan maksud dan tujuan serta kegiatan usahanya sesuai KBLI 2017 melalui SABH Direktorat Jenderal Administrasi Hukum Umum. Penyesuaian tersebut dilakukan melalui perubahan anggaran dasar perseroan sebagaimana dimaksud dalam ketentuan Pasal 21 ayat (2) Undang-Undang Nomor 40 Tahun 2007 tentang Perseroan Terbatas, yang harus mendapat persetujuan Menteri (Menteri Hukum dan HAM).

Seluruh data yang tercantum dalam NIB dapat berubah sesuai dengan perkembangan kegiatan berusaha

Ditetapkan tanggal : 29 Maret 2019

Dokumen ini dikeluarkan dari Sistem OSS atas dasar data dari pelaku usaha. Kebenaran dan keabsahan atas data yang ditampilkan dalam dokumen ini dan data yang tersimpan dalam Sistem OSS menjadi tanggung jawab pelaku usaha sepenuhnya.

ALDEOZ We Space

SURAT KETERANGAN DOMISILI

001/AWS/I/24

Kami yang bertanda tangan dibawah ini bertindak untuk dan atas nama Aldeoz We Space yang berlokasi di Gedung Aldeoz Lantai 3, Jl. Warung Jati Barat No.39, Kalibata, Pancoran, Jakarta Selatan 12740.
Sebeagai pengelola dengan ini menerangkan bahwa :

Nama Perusahaan	: **PT. Prondt Indo Utama**
Nama Penanggung Jawab	: **Reno Putra Chaniago**
Alamat	: Gedung Aldeoz Lantai 6
	Jl. Warung Jati Barat No.39 RT 010 RW 004
	Kalibata, Pancoran, Jakarta Selatan 12740

Adalah benar menyewa Virtual Office di Gedung Aldeoz Lantai 6, masa sewa selama 2 (dua) tahun mulai dari tanggal 03 Januari 2024 sampai dengan tanggal 02 Januari 2026.
Demikianlah Surat Keterangan ini dikeluarkan kepada pihak yang memberikan bantuannya, kami ucapkan terima kasih.

safety

AUDIT BAPETEN

PT PIU(Company) was formed in 2019 with activities in supply of equipment and services to the Oil & Gas Industry and Geothermal realized that Health, Safety and Environment Protection (HSEP) which is an important consideration to be related to the risk to be faced in its operation.

In the frame of this policy, Company will be responsible to encourage of Health, Safety and Environment Protection Program in all aspect of its operation, and it is representative of this commitment that Company has prepared and distributed this HSEP Handbook to all Employees.

Company's expectation is that Employees and all concerned parties commit them selves to understand and perform all task as defined in HSEP.

Safety is an integral, critical and first & foremost part of our corporate philosophy, culture, operation and performance of services we deliver.

We promotes and maintains a safe work environment and will not compromise the health of our employees or the environment of our community.

We promotes our Safety environment through:
Safety meeting, educating and training.
Adhering safety policies and procedures devised by PT PIUand out clients.
On going safety program monitoring Total Recordable Injuries and Illness.

PT PIU commitment to the Safety, Health and Welfare of all our employees is evident through our comprehensive Health care Benefit Program along with:

Mandatory Drug and Alcohol test.
Annual vision screening.

Preserving our environment for the community now and in the future by PT PIUis realized through:
Complying with all applicable Environmental, Health and Safety laws and regulations.
Increased commitment for recycling and responsible management of energy use.
